

Section 2.8 – One-to-One Functions and Their Inverses

- A function with each element عنصر in the range matches **one, and-only-one**, element in the domain is called one-to-one function

الدالة التي يرتبط كل عنصر من المجال **بعنصر واحد فقط** من المدى تسمى **دالة متباينة**

One-to-one function

لأن كل عنصر من المجال

مرتبط بعنصر واحد فقط من

المدى domain

Not one-to-one function

لأن أحد عناصر المجال

مرتبط بأكثر من عنصر من المدى

domain

لاحظ

تذكر أن ارتباط أحد عناصر المدى domain بأكثر من عنصر في المجال range يعني أن العلاقة ليست دالة أصلاً

- يمكن معرفة إذا كانت الدالة one-to-one من الرسم، برسم خط أفقي: إذا قطع منحنى الدالة أكثر من مرة لا تكون one-to-one

Not one-to-one function

لأن الخط الأفقي قطع منحنى الدالة مرتين

Example 1

Is the function $f(x) = x^2$ one-to-one?

Solution

$$\begin{aligned} f(a) &= f(b) \\ a^2 &= b^2 \\ a &= \pm \sqrt{b^2} \\ &= \pm b \end{aligned}$$

Not one-to-one

Example 2

Is the function $f(x) = x^3$ one-to-one?

Solution

$$\begin{aligned} f(a) &= f(b) \\ a^3 &= b^3 \\ a &= b \end{aligned}$$

One-to-one

In order for $f(a)$ to be equal to $f(b)$ a must be equal to b

Example 3

Show that the function $f(x) = 3x + 4$ is one-to-one.

Solution

$$f(a) = f(b)$$

$$3a + 4 = 3b + 4$$

$$3a = 3b$$

$$a = b$$

One-to-one

- For any one-to-one function $f(x) = y$ with domain A and range B , there is an **inverse function** دالة عكسية $f^{-1}(y) = x$ with domain B and range A

Example 4

If $f(1) = 5$, and $f(8) = -10$, find $f^{-1}(5)$, and $f^{-1}(-10)$

Solution

$$f^{-1}(5) = 1$$

$$f^{-1}(-10) = 8$$

Example 5

Given $f(x) = \sqrt{x-2}$. Find $f^{-1}(5)$

Solution

$$\begin{aligned} f(x) &= 5 \\ \sqrt{x-2} &= 5 \\ x-2 &= 25 \\ x &= 27 \\ f^{-1}(5) &= 27 \end{aligned}$$

- To find the inverse of a function

1- اكتب $y = f(x)$

2- أوجد x كمعادلة في y

3- بدل x و y لتصبح المعادلة $y = f^{-1}(x)$

Example 6

Find the inverse of the functions.

(a) $f(x) = 3x - 2$

(b) $f(x) = \frac{x^5 - 3}{2}$

Solution

(a) $y = 3x - 2$ $y + 2 = 3x$ $\frac{y+2}{3} = x$ $x = \frac{y+2}{3}$ $f^{-1}(x) = \frac{x+2}{3}$	(b) $y = \frac{x^5 - 3}{2}$ $2y = x^5 - 3$ $2y + 3 = x^5$ $x = \sqrt[5]{2y + 3}$ $f^{-1}(x) = \sqrt[5]{2x + 3}$
---	---

- Inverse Function Property خاصية الدالة العكسية:

for any function $f(x)$ with an inverse function $f^{-1}(x) \rightarrow f(f^{-1}(x)) = f^{-1}(f(x)) = x$
مثال:

$$f(x) = 3x - 2 \text{ and } f^{-1}(x) = \frac{x+2}{3}$$

$$\therefore f(f^{-1}(x)) = 3 \frac{x+2}{3} - 2 = x$$

Example 7

Use the Inverse Function Property to show that f and g are inverses of each other.

$$f(x) = 2 - 5x, g(x) = \frac{2-x}{5}$$

Solution

$$f(g(x)) = 2 - 5 \left(\frac{2-x}{5} \right)$$

$$= 2 - (2 - x)$$

$$= 2 - 2 + x = x$$

Therefore $f(x)$ and $g(x)$ are inverse

Example 8

A graph of a function is given.
Use the graph to find the indicated values.

(a) $f^{-1}(2)$

(b) $f^{-1}(5)$

(c) $f^{-1}(6)$

Solution

(a) $f^{-1}(2) = 6$

(b) $f^{-1}(5) = 2$

(c) $f^{-1}(6) = 0$

Example 9

A table of values for a one-to-one function is given. Find (a) $f^{-1}(2)$, (b) $f^{-1}(0)$

x	1	2	3	4	5	6
$f(x)$	4	6	2	5	0	1

Solution

(a) $f^{-1}(2) = 3$

(b) $f^{-1}(0) = 5$

Problems

- A graph of a function f is given. Determine whether f is one-to-one.

- Determine whether the function is one-to-one function.

(a) $f(x) = -2x + 4$

(b) $g(x) = \sqrt{x}$

(c) $h(x) = x^2 - 2x$

- Find the inverse function of f .

(a) $f(x) = 3x + 5$

(b) $f(x) = \frac{x}{x+4}$

(c) $f(x) = 4 - x$

- (a) Find the inverse function of the function $f(x) = \frac{2x+3}{x-1}$

(b) Find the domain and range of $f(x)$

(c) Find the domain and range of $f^{-1}(x)$
